UNDER THE GUIDANCE OF
Mr. Sandeep (Ass Prof.)

INTRODUCTION

- During the pandemic COVID-19, WHO (World Health Organization) has made wearing a mask is mandatory when we step out of our house to protect against this deadly virus.
- So, we built a real-time system to detect whether the person is wearing a mask or not using the webcam.
- This application can be implemented in public places like schools, colleges, hospitals, airports etc..

EXISTING SYSTEM

- In previous version it used to take the uncolored images for training the dataset, here we used the colored images directly for training the dataset.

PROPOSED SYSTEM

- The main aim of the project is to detect the presence of a face mask.
- We will use a live video stream(web cam).
- And finally, in the output, it shows the masked and unmasked faces with accuracy.

SYSTEM SPECIFICATIONS

SOFTWARE REQUIREMENTS :

- Operating system : Windows-10.
- Source code : Python.
- IDE : Anaconda prompt
- Tools and libraries : Tensorflow, Keras, opencv, MobilenetV2.

HARDWARE REQUIREMENTS:

- RAM : 8GB.

FLOW CHART

Phase #1 :Train Face Mask Detector

Phase #2: Apply Face Mask Detector

MODULE

PRE PROCESSING:

- First we need to convert all the images from dataset into arrays.

TRAINING:

- We need to train the dataset using the tensorflow and keras using CNN(Convolutional neural network).

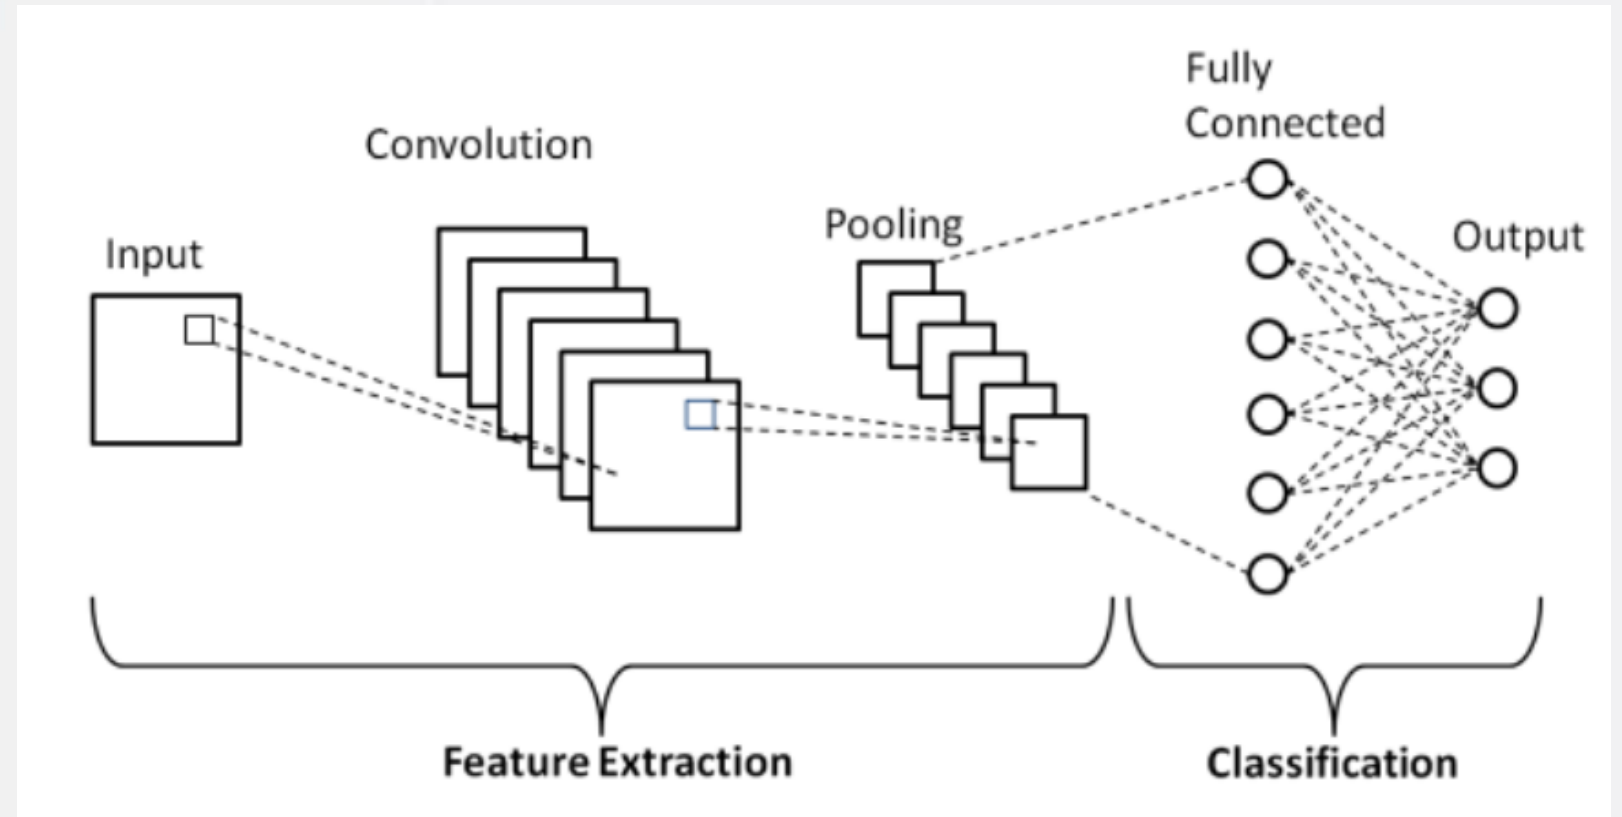

Fig.1 CNN(Convolutional Neural Network)

DEPLOYMENT:

- Need to detect the faces from live video stream and extract the ROI(region of interest) for each face using the opencv and mobilenetv2.

TESTING:

- In result, if the ROI turns into the red color the person is not wearing the mask.
- If the ROI turns into the green color the person is wearing the mask.
- We can also find the accuracy earned in determining the correct results.

[illegible][illegible]

FUTURE SCOPE

- Firstly, the proposed technique can be integrated into any high-resolution video surveillance devices and not limited to mask detection only.
- Secondly, the model can be extended to detect facial landmarks with a facemask for biometric purposes.

CONCLUSION

- Prevention such as vaccines is one of the most effective measures to mitigate such a catastrophic public health crisis.
- Prior to vaccine, wearing mask can potentially reduce the virus transmission.
- COVID-19 mask detector could potentially be used to help ensure your safety and the safety of others.

ANY QUERIES

THANK YOU !
